

VSP5600 Performance Analysis Report

Storage Performance & Capacity Analysis

Report Generated: 20251231_114344
Data Extraction Date: 20251231_114344

This report provides a comprehensive analysis of storage performance metrics collected from the Hitachi VSP5600 system. It includes detailed charts and analysis of cache performance, processor utilization, port response times, and LDEV (Logical Device) metrics.

6.1 Cache Metrics: Write Pending Rate vs Cache Usage Rate

Analysis:
Cache write pending rate is within normal limits.

6.2 MPU Usage Analysis

Analysis:
MPU usage is within normal operating range.

6.3 HIE Metrics: Internal Path Utilization

Analysis:
The chart does not show any saturation of the HIE - ISW and MPU - HIE internal paths.

6.4 Port Response Times

Analysis:
Port response times are in the normal operating range.

6.5 LDEV IOPS Analysis

Analysis:
The chart identifies the LDEVs with high IO activity.

6.6 LDEV Transfer Rate Analysis

Analysis:
The LDEVs that have high transfer rate are identified in this chart.

6.7 LDEV Response Time vs MPU Usage

Analysis:
LDEV response times during the monitoring period are shown.

6.8 LDEV Read Hit Analysis - LDEV 01:00:00:E2X

Analysis:
These set of charts shows the read hit%, read percentage and read response.

6.8 LDEV Read Hit Analysis - LDEV 02:00:00:F8X

Analysis:
These set of charts shows the read hit%, read percentage and read response.

6.8 LDEV Read Hit Analysis - LDEV 03:00:00:F5X

Analysis:
These set of charts shows the read hit%, read percentage and read response.

6.8 LDEV Read Hit Analysis - LDEV 04:00:00:E0X

Analysis:
These set of charts shows the read hit%, read percentage and read response.

6.8 LDEV Read Hit Analysis - LDEV 05:00:00:D0X

Analysis:
These set of charts shows the read hit%, read percentage and read response.

6.9 Port IOPS Analysis

Analysis:
Port IOPS during the monitoring period are shown. High IOPS ports indicate active workload on those ports.

6.9 Port IOPS vs MPU Utilization

Analysis:

This chart correlates Port IOPS with MPU Utilization. High port IOPS combined with elevated MPU utilization may indicate processor bottlenecks. If MPU utilization remains low despite high IOPS, the system has adequate processing headroom.

6.10 Port Transfer Rate Analysis

Analysis:
Port transfer rates (throughput) during the monitoring period are shown. High transfer rate ports indicate heavy data movement on those ports.
